Refinding information found on the web is a considerable problem for many users, especially when in mobile situations. In this paper, we explore how a voice-controlled service, accessible by telephone, could help to support mobile users' needs for refinding specific information previously found on the web. We outline challenges in creating such a service and describe architectural and user interfaces issues involved in an exploratory prototype system called WebContext. We also present the results ...

Keywords: conversation analysis, information management, information refinding, speech recognition, voice user interfaces
